To run the application on a Windows machine, follow these steps:

1. Requirements
Ensure the Windows machine has **Java 17 or higher** installed. You can verify this by opening the Command Prompt (`cmd`) and running:
```cmd
java -version
```

2. Running the Application
The `releases/windows/` folder has been prepared with everything you need:

1. **Copy the Windows folder:** Transfer the entire [releases/windows/](file:///Users/parthip/crime-management-system/releases/windows) folder to your Windows machine.

2. **Launch the app:** Inside that folder, double-click **`run_windows.bat`** (or execute it via command prompt):
   ```cmd
   run_windows.bat
   ```

This will launch the Swing desktop application via `javaw` using the main `DesktopLauncher` loader in the background.

3. Creating a Windows `.exe` installer (Optional)
If you wish to create a native Windows executable (`.exe`) installer:

1. On a Windows machine, make sure you have [WiX Toolset](https://wixtoolset.org/) installed.

2. Run **`package-win.bat`** located inside the same folder:
   ```cmd
   package-win.bat
   ```
   This will package the runnable `.jar` and its resources into a native Windows installation package.
